Which Tutorial is Right for Me?

A number of tutorials for learning about Sentinel LDK are available. We recommend that you review the information below to ensure that you choose the tutorial that is most appropriate for your requirements.

All the tutorials are included in the Sentinel LDK Demo kit and Starter kit.

Software Protection and Licensing Tutorial – Sentinel SL (Software-based) Keys

This tutorial demonstrates how to protect and license an application with Sentinel SL (software) protection keys.

Requirements: Download the free Sentinel LDK Demo Kit. *No hardware keys are required to perform this tutorial.*

The remaining tutorials described below demonstrate how to protect and license an application with either Sentinel SL (software) or Sentinel HL (hardware) protection keys.

Software Protection and Licensing Tutorial – “Demo Kit” or “Starter Kit”

Sentinel EMS (*Entitlement Management System*) is used as the back office system to manage definition of Features and Products and to generate and track customer entitlements.

- The **Demo Kit** tutorial uses a provided demonstration hardware key.

Requirements: Obtain the free physical Sentinel LDK Demo Kit from your Gemalto sales representative or from the Gemalto web site.

- The **Starter Kit** tutorial uses your own Sentinel Developer key and Sentinel HL key to protect and license an application.

Requirements: Purchase the Sentinel LDK Starter kit and Sentinel HL protection keys from your Gemalto sales representative.

Software Protection and Licensing API Tutorial – “Demo Kit” or “Starter Kit”

These tutorials demonstrate how you can use Sentinel LDK APIs to generate and update licenses. It is assumed that you would use your own back office systems to handle all ERP functionality.

A **Demo Kit** tutorial and a **Starter Kit** tutorial are available as described above.

Introduction

Thank you for choosing Sentinel License Development Kit (*Sentinel LDK*) as the method to protect and license your software against unauthorized use. In this Tutorial, you use the Sentinel LDK system to protect, license, and distribute software.

The strength, uniqueness, and flexibility of Sentinel LDK are based on two primary principles:

- *Protect Once—Deliver Many—Evolve Often™*: the concept of separating the software engineering and business processes
- *Cross-Locking*: the technology that supports the *Protect Once—Deliver Many—Evolve Often* concept, enabling a protected application to work with a Sentinel HL (hardware) or a Sentinel SL (software) key

All commercial decisions, package creation, and license definitions are executed by product or marketing managers after the protection has been implemented.

This workflow model provides you with greater flexibility and freedom when defining new sales and licensing models, including feature-based and component licensing, evaluation, rental, floating, subscription, trialware (trial/grace), pay-per-use, and more, enabling you to focus on revenue growth.

Sentinel LDK System

The Sentinel LDK system provides you with a wide range of options for handling the business processes associated with producing and distributing your protected applications and Sentinel protection keys:

- You can use the Sentinel EMS web interface and Sentinel EMS Server as a complete standalone system.
- You can use the Sentinel EMS Web Services and Sentinel EMS Server software to connect the Sentinel LDK system with your existing ERP and CRM back office systems.
- You can use the Sentinel License Generation API together with your existing licensing server software and ERP and CRM back office system for maximum flexibility and control over your business processes.

Regardless of the option you choose for handling your business processes, you will use Sentinel LDK Envelope or Sentinel Licensing API (or both) to protect your application and define the features that can be licensed.

This tutorial demonstrates the use of the Sentinel License Generation API to generate and maintain Sentinel protection keys. The License Generation API provides the functionality for securely updating Sentinel HL keys and SL keys, both locally and at the customer site.

In this tutorial, it is assumed that your organization will employ its own back office systems to handle all other aspects of tracking Features and Products, and of managing and tracking customer interactions. Your back office systems for Features and Products are represented in the tutorial lessons by a spreadsheet (shown below).

	A	B	C	D	E
1	Vendor Back Office ERP System

Sentinel Keys

You will use the following Sentinel keys to perform the lessons in this tutorial:

- Sentinel Developer key (yellow), used to protect your programs
- Sentinel Master key (blue), used for license production.
The Sentinel Master key must stay connected to the Sentinel EMS Server machine.

The Sentinel Developer key and Sentinel Master key are included in the Starter Kit. These keys are referred to as *Sentinel Vendor Keys*.

- One or more end-user Sentinel HL keys, used to run the protected program (color depends on key type). Sentinel HL keys were ordered separately and are provided in a separate package.

This tutorial is only partially applicable for Sentinel HL Basic keys. Sentinel HL Basic keys can be used only to protect your programs, and not to set licensing terms.

Conventions

Each of the lessons in this tutorial begins with a focused breakdown of the lesson, similar to the following:

Objective	A short description of the lesson objective
Role in this lesson	The role or roles that you assume during the lesson
Applications used	Sentinel LDK applications you use in the lesson

Lessons in This Tutorial

This tutorial is based on a Windows operating system and includes the following lessons:

- **"Lesson 1: Preliminary Preparation" on page 13**

In this lesson, you install the Sentinel LDK system and learn how to launch Sentinel Vendor Suite. You then introduce your Sentinel Master key and Sentinel Developer key into the Sentinel LDK system.

- **"Lesson 2: Defining Features and Products" on page 17**

In this lesson, you will use your back office ERP system to record the attributes of the Features that you will later license and protect, and the Products that will be based on these Features.

- **"Lesson 3: Using Sentinel LDK ToolBox" on page 21**

In this lesson, you learn about the Sentinel ToolBox. This advanced user interface enables you to work with API function calls before you write even a single line of programming code.

- **"Lesson 4: Protect Once" on page 25**

In this lesson, you use Sentinel LDK Envelope to apply protection to your software.

- **"Lesson 5: Defining an Unlocked Trialware Product" on page 29**

In this lesson, you generate a license for an Unlocked Trialware Product, based on one of the Products you defined. This will enable you to distribute a trial version of your software later.

- **"Lesson 6: Creating and Distributing a Sentinel SL-protected Software Order" on page 35**

In this lesson, you lock your protected software to a Sentinel SL key for later distribution. You will code the Sentinel SL key for a customer, and use the software as an end user. You will also learn how to activate a license, in order to convert the trial version of a program to a full-featured program.

- **"Lesson 7: Creating and Distributing a Sentinel HL-protected Software Order" on page 41**

In this lesson, you lock your protected software to a Sentinel HL key for later distribution. You will code the Sentinel HL key for a customer order, and use the software as an end user. You will also learn how to create a license update for a deployed Product that has its license locked to a Sentinel HL key.

- **"Lesson 8: Using Sentinel Licensing API" on page 49**

In this lesson, you learn how to use the Licensing API to program the memory on Sentinel protection keys.

We recommend that you follow the lessons sequentially to familiarize yourself with the Sentinel LDK system and to gain a clear understanding of the strength of the *Protect Once—Deliver Many—Evolve Often* model, and the flexibility it provides.

Additional Resources

You can use the following resources to help you learn about the Sentinel LDK system:

- **Sentinel LDK Software Protection and Licensing Guide**

This book describes Sentinel LDK licensing concepts and provides a detailed overview of the system.

- **Sentinel LDK Release Notes**

The Release Notes provide information about the current release, including:

- latest enhancements
- supported platforms
- available documentation
- known issues

- **Instructional videos**

A library of instructional videos for Sentinel LDK is available at:

<http://sentinelvideos.gemalto.com/>

Obtaining Support

You can contact us using any of the following options:

Business Contacts - To find the nearest office or distributor, use the following URL:

<https://sentinel.gemalto.com/contact-us-sm/>

Technical Support

To obtain assistance in using Gemalto products, feel free to contact our Technical Support team:

- **Customer Support Portal** (preferred):
<https://supportportal.gemalto.com/csm?id=sentinel>
 - **Support Essentials** (Contact details, support plans, and policies):
https://supportportal.gemalto.com/csm?id=support_essentials
 - **For Issues Related to Using the Portal:** customerportalsupport@gemalto.com
 - **Phone:**
 - AMER: 800-545-6608 (US toll free)
 - International: +1-410-931-7520
 - EMEA/APAC: <https://supportportal.gemalto.com/csm?id=sentinel>
- ➔ Click **Contact Us**
- **E-mail** (Use if you cannot submit the technical issue via the portal):
technical.support@gemalto.com

Downloads

You can download installers and other updated components here:

<https://sentinelcustomer.gemalto.com/sentineldownloads/>

Preliminary Preparation

Objective	Prepare your computer and Sentinel LDK for the tutorial
Applications used	<ul style="list-style-type: none">■ Sentinel LDK Installation Drive■ Sentinel Master Wizard■ Sentinel Vendor Suite

The procedures in this lesson are required in order for you to be able to implement the processes outlined in subsequent lessons of this tutorial. They include:

- Instructions for installing the Sentinel LDK software, including Sentinel EMS Server
- Instructions for launching Sentinel Vendor Suite
- Instructions for introducing the Sentinel Vendor keys to the Sentinel LDK system

Installing the Sentinel LDK Software

Before proceeding with this tutorial, install the Sentinel LDK software and the Sentinel EMS Server on your computer.

WARNING

Do not connect any of your Sentinel keys before installing the Sentinel LDK software!

For instructions on how to install Sentinel EMS and Sentinel LDK Vendor Tools, refer to the chapter “Installing Sentinel LDK for Windows” in the *Sentinel LDK Installation Guide*.

During the installation procedure, you can accept all defaults. When prompted to choose a setup type for Sentinel EMS, click the **Express** option.

After the installation has completed, select **All Programs > Gemalto Sentinel > Sentinel LDK > Check for Updates** from the Start menu. The Software Manager window will indicate to you if a later version of any of the Sentinel LDK software is available from Gemalto servers. If a later version is available, select the option to install it.

Launching Sentinel Vendor Suite

After completing the installation, launch Sentinel Vendor Suite as follows:

1. If you are not certain that the Tomcat service is active: From the **Start** menu, select **Programs > Gemalto Sentinel > Sentinel EMS > Start EMS Service**.
2. From the **Start** menu, select **Programs > Gemalto Sentinel > Sentinel LDK > Vendor Suite**. The Sentinel Vendor Suite program selection screen is displayed. You can access the primary Vendor Suite applications from this screen.

Introducing the Sentinel Vendor Keys

Sentinel Vendor keys (Sentinel Master key and Sentinel Developer key) enable you to apply Sentinel LDK protection to your software and data files, to program the Sentinel protection keys that you send to your end users, and to specify the license terms under which your software can be used.

The Sentinel Developer key is used by your software engineers in conjunction with the Sentinel LDK protection applications to protect your software and data files. The Sentinel Master key is connected to the Sentinel EMS Server computer and used in conjunction with Sentinel EMS for defining Features and Products, applying license terms, and producing entitlements.

In order to complete this tutorial, you need to introduce your Sentinel Vendor keys to the Sentinel LDK system.

To introduce your Sentinel Vendor keys:

1. After starting the EMS (Tomcat) service, connect your Sentinel Developer key and your Sentinel Master key to a USB port. (Ensure that the Sentinel Master key is connected to the Sentinel EMS Server machine).
2. Start Sentinel Master Wizard as follows:
 - From the Start menu, select: **Programs > Gemalto Sentinel > Sentinel LDK > Tools > Sentinel Master Wizard**

 If you open either Sentinel LDK Envelope or Sentinel LDK ToolBox, and the application detects a new Sentinel Vendor key, the Master Wizard will launch automatically.

3. In the **User Name** and **Password** fields, type **admin**; then click **OK**.
4. Accept all defaults through the completion of the wizard.

 The first time the Master wizard is run for a specific Master key, Gemalto servers generate and download your customized API libraries. This process typically require about 20 minutes to complete. However, if there is a backlog, the generation process may require up to several hours to complete.

The generated APIs are located in the following directory, under the appropriate subdirectory:

`%HomePath%\Documents\Gemalto\Sentinel LDK 7.8\API\Runtime\`

5. Click **Finish** to close the wizard. This process introduces the data in your key to the Sentinel LDK system and extracts your company's unique confidential Vendor Code.

For additional information on Vendor Codes, see *Understanding Sentinel LDK Software Protection and Licensing* in the *Sentinel LDK Software Protection and Licensing Guide*.

You are now ready to start the tutorial.

Sentinel EMS provides a notification facility for your Master key. This facility can send automatic e-mail reminders when:

- any of the license modules on the Master key are about to expire.
- the pool of new SL keys or network seats on the Master key falls below a certain threshold.

Gemalto highly recommends that you configure the notification facility to send reminders as necessary. In the Sentinel EMS screen, on the main menu, click **Administration > Master**. Follow the instructions to configure e-mail reminders.

Defining Features and Products

Objective	Learn how to define Features and Products
Role in this lesson	Product Manager
Applications used	Spreadsheet or Your ERP system

This lesson is not applicable for Sentinel HL Basic keys.

A *Feature* is an identifiable functionality of a software application that can be independently protected or licensed. In Sentinel LDK, a Feature may be an entire application, a module, or a specific functionality such as Print, Save, or Draw.

A *Product* is a licensing entity that represents one of the vendor's marketable software products. The Product contains one or more Features. License terms are defined for each Feature in the Product.

Defining Features

Features are typically defined by the Product Manager based on business decisions, and are then implemented by the company's software engineers.

You define Features by:

- selecting the functions in your application that you want the ability to license individually.
- adding calls to the Sentinel Licensing API from the appropriate functions in your application.
- protecting your application using Sentinel LDK Envelope.

Features to be licensed in a products are typically recorded in Sentinel EMS or in your ERP system. Since the scope of this tutorial does not include Sentinel EMS, we will record two Features in our

ERP system. For the purposes of this tutorial, we will use a spreadsheet as our back office ERP system.

Defining Products

You define a Product by:

- generating a license definition in the Sentinel License Generation API.
- applying the generated license definition to a Sentinel protection key.

Like Features, Products are typically defined using Sentinel EMS. Typically, this function is performed by the Product Manager, and implemented by the software engineer. In a true production environment, a number of Products might be defined and held in readiness for inclusion in customer orders. However, you can define new Products—mixing and matching Features—at any time.

For the lessons in this tutorial, we will define a number of Products. The Products will include license terms for the two Features mentioned above. The Products that we define now will be included in the orders that you define in later lessons. As with the Features, we will record the Products in our ERP “system.”

In this lesson, we define the following Products:

- “Bounce_Lite”—A “rental” Product, in which the license expires after three executions. Following the third execution, the license must be updated to enable further use of the program.
- “Bounce_Full”—A “full-featured” Product, in which the license enables unrestricted access to all the Features in the program.
- “MyNotepad_Full”— A “full-featured” Product that enables unrestricted access to all the Features in the program. In [Lesson 5: Defining an Unlocked Trialware Product](#), you will define an evaluation **MyNotepad** Product. The **MyNotepad_Full** Product you define in this lesson will later be used to update the evaluation license to a full-featured license.

In [Lesson 6: Creating and Distributing a Sentinel SL-protected Software Order](#), and [Lesson 7: Creating and Distributing a Sentinel HL-protected Software Order](#) you will assume the role of an end user, and will install licenses and run these Products.

Our ERP System

The spreadsheet displayed below contains the information that would be stored in the ERP system.

The spreadsheet contains:

- The two Features that we will protect in our applications. Each Feature is assigned a name and an ID.
- The three base Products described above. For each Product, the system lists the Features contained in the Product and the attributes of the Product.

	A	B	C	D	E
1	Vendor Back Office ERP System				
2					
3	Features				
4		Feature Name	Bounce	MyNotepad	
5		Feature ID	50	10

ERP System - Features and Products

Using Sentinel LDK ToolBox

Objective	Learn how to work with Sentinel LDK ToolBox
Role in this lesson	Development
Applications used	Sentinel LDK ToolBox

Before you begin the other lessons in this tutorial, you should have a basic understanding of how Sentinel LDK ToolBox works. Sentinel LDK ToolBox is an interactive GUI application that helps you familiarize yourself with various Sentinel LDK APIs. In addition, you can use Sentinel LDK ToolBox to actually execute API functions.

This lesson introduces you to:

- **Sentinel LDK License Generation API.** This API is used in the software vendor production environment to generate new and updated licenses for Sentinel protection keys.
- **Sentinel LDK Licensing API.** This API exists in the software vendor production environment and in the Run-time Environment on the end user's computer. The API is used for advanced protection techniques for the protected application and to enforce licensing parameters for the protected application.

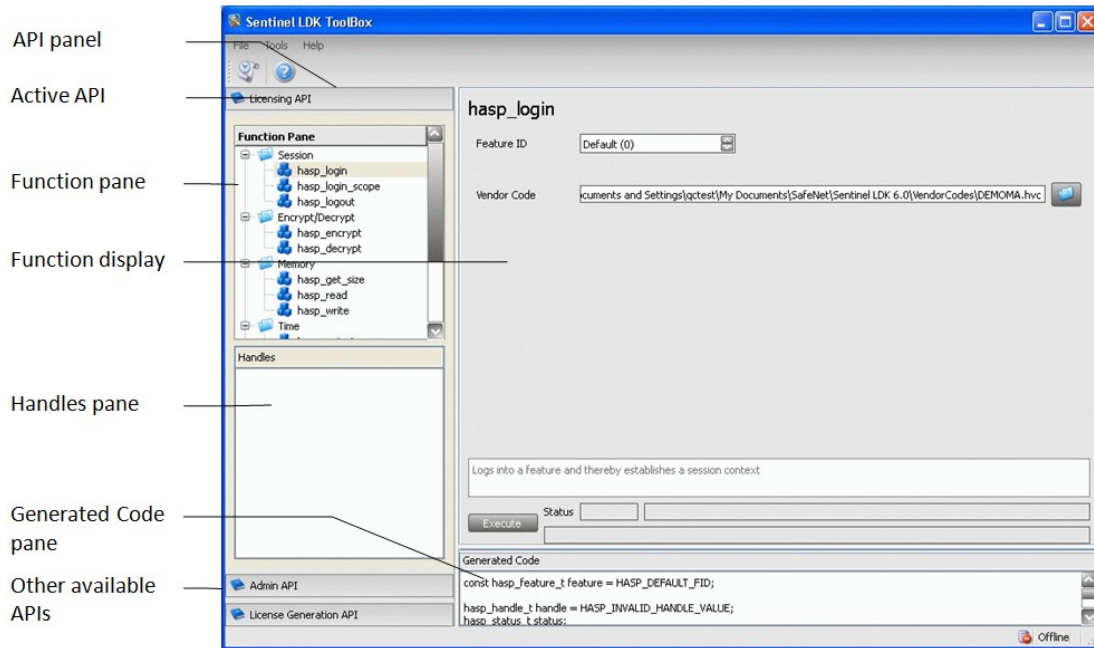

You can also use Sentinel LDK ToolBox to generate source code that you can immediately copy and paste into your own application source code.

The Sentinel LDK ToolBox window contains these elements:

- API panel, in which you select the API to work with
- Function pane, in which you select the function to perform
- Display pane, in which you can view and edit the details of the function call you selected
- Generated Code pane, in which code is displayed. You can copy this code and paste it

into your own files.

- Handles pane, in which the session handle is displayed

To launch Sentinel LDK ToolBox:

1. From the **Start** menu, select **Programs > Gemalto Sentinel > Sentinel LDK > Vendor Suite**. The Vendor Suite program selection window is displayed.
2. Click **ToolBox** to launch the Sentinel LDK ToolBox application. The Sentinel LDK ToolBox main window is displayed.

The API panel on the left of the ToolBox window contains all the available APIs. For the selected API, the available functions are displayed.

3. Browse the list. You can select any API, and then select an available function for that API. After you select a function, the Display pane on the right of the ToolBox window displays the parameters that you must specify in order to execute the function call.

Selecting Your Programming Language

Sentinel LDK ToolBox can generate code in several programming languages.

To select your programming language:

1. From the **File** menu in Sentinel LDK ToolBox, select **Settings**. The Settings window is displayed.
2. Select the **ToolBox** tab.
3. From the **Programming language** drop-down list, select your preferred language.

For this tutorial, it is recommended that you select **C-API**. If C-API is not selected, select it and click **OK**. If C-API is already selected, click **Cancel**.

The Settings window closes with the programming language selected.

Working With the License Generation API

This section demonstrates how to get started with the License Generation API in order to generate new or modified licenses for a Sentinel protection key.

This is not a complete exercise. The purpose of this section is to demonstrate how you perform functions in Sentinel LDK ToolBox.

Initializing a Session

Each License Generation API session begins with the `sntl_lg_initialize` function call, which initializes libraries and establishes a session handle.

While you work with License Generation API in ToolBox or in your own application, you can initialize and maintain up to 512 simultaneous license generation sessions. For each session, you use the unique handle created by the `sntl_lg_initialize` function in all subsequent function calls to isolate the functions from other active sessions.

In this tutorial, we will work with only one active session at any given time.

To initialize a license generation session:

1. In the API panel, click **License Generation API**.
2. In the Function pane, select `sntl_lg_initialize`.
3. This function requires no parameters, so we simply execute the function.

At the bottom left of the `sntl_lg_initialize` pane, click **Execute**. The result of the executed initialization is summarized to the right of the **Execute** button in three **Status** fields—number, code and message. If the function complete successfully, the session handle is displayed in the **Handles** pane.

Note that the programming code required to perform this same function in your own application is now displayed in the **Generated Code** pane. As long as ToolBox remains active, you can click  to access the API Call History dialog box. This screen contains a history of all the function calls that you executed and the generated programming code for each function call.

Starting a License Definition

Each license that you generate begins with the `sntl_lg_start` function call. This function starts the process of defining a new license or an update to an existing license. (In many cases, this is the *only* function that you require to define a license.) You use this function to assemble all the information required for a license. This consists of:

- The type of license to generate
- Your Vendor code
- Current state of the protection key

- XML code that contains the license definition parameters. This can be a combination of:
- code copied from a template
- code that you enter manually
- code created using tools included in the ToolBox.

To start a license definition:

1. In the Function pane, select **sntl_1g_start**. The parameters for this function appear in the Function Display.
2. For **License Type**, select **SNTL_LG_LICENSE_TYPE_PROVISIONAL**.
3. In the **Vendor Code** field, specify the location of your stored Vendor Code file.

To locate your Vendor Code file, click the browse button.

By default, Vendor Codes are stored in:

%HomePath%\Documents\Gemalto\Sentinel LDK 7.8\VendorCodes

The file is named according to the label printed on your keys. For example, if the keys are labeled with Batch Code ABCDE, by default, your Vendor Code file is named **ABCDE.hvc**.

4. Select your Vendor Code file and click **Open**. The path name is displayed in the **Vendor Code** field.
5. For a trialware license, the **Current State** field is left empty.

The **License Definition** field can be filled out using one or more of the following techniques:

- a. You can select a value for the **License Template** field to enter a predefined license definition.
 - b. You can use the built-in function buttons (such as **New Definition** or **Edit Current Block**) to enter or modify a license definition.
 - c. You can manually enter or modify XML code in the **License Definition** field.
6. For this demonstration, select **New Provisional Product** in the **License Templates** field. ToolBox fills in the **License Definition** field with the XML code to define a sample Unlocked Trialware Product.
 7. At the bottom left of the **sntl_1g_start** pane, click **Execute**. The results of the executed **start** function are displayed to the right of the **Execute** button in three **Status** fields—number, code and message.

What's Next?

You have actually started the process to define a trialware license for a Sentinel protection key. We will not continue this specific process at this point, but we will use the techniques that were demonstrated here in the lessons that follow.

Protect Once

Objective	Learn how to apply Sentinel LDK automatic protection functionality
Role in this lesson	Development
Applications used	Sentinel LDK Envelope

In this lesson, you use Sentinel LDK Envelope to define protection parameters for two programs, using the two Features you defined earlier.

Sentinel LDK Envelope is an innovative, advanced solution for protecting software against illegal or unauthorized use. The solution deters illegal access and execution of protected applications.

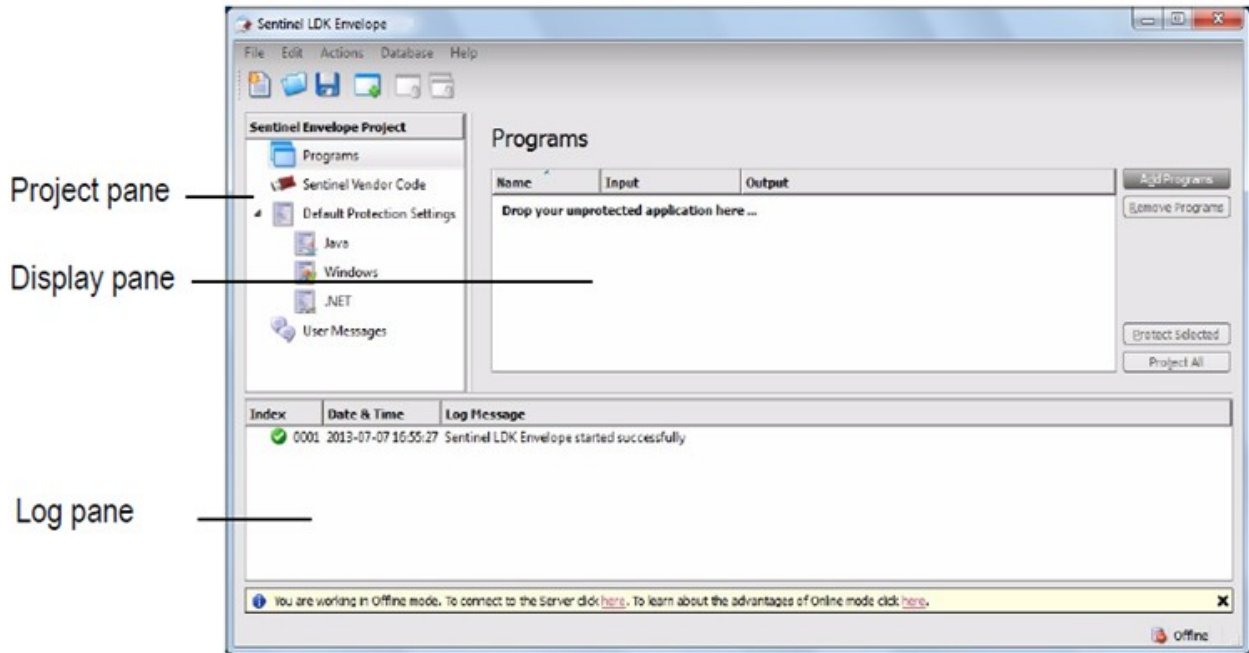

A deployed Sentinel LDK-protected program requires access to a Sentinel protection key in order to run. The protected program queries the Sentinel protection key for predefined information. If the Sentinel protection key is not present, or the information returned is incorrect, the program does not execute, or stops functioning.

Protecting the Sample Bouncing Ball Program

In this section, you launch Sentinel LDK Envelope and identify the Vendor Code with which you will protect the software. You then define an end-user error message. Finally, you protect the Bouncing Ball program.

The Sentinel LDK Envelope window includes the following:

- Project pane, in which you select the function to perform
- Display pane, in which you select items and perform actions. The name of the pane changes to reflect the function you selected in the Project pane—for example, in the screen below, the Display pane has the title **Programs**.
- Log pane, in which Sentinel LDK Envelope messages are displayed

To prepare for protection:

1. Connect the Sentinel Developer key.
2. From the **Start** menu, select **Programs > Gemalto Sentinel > Sentinel LDK > Vendor Suite**. The Sentinel Vendor Suite program selection window is displayed.
3. Click **Envelope** to launch Sentinel LDK Envelope. The Sentinel LDK Envelope main window is displayed.
4. Before protecting an application, Sentinel LDK Envelope must identify the correct Vendor Code. In the Sentinel LDK Envelope Project pane, select **Sentinel Vendor Code**.
5. In the right pane of the Sentinel Vendor Code window, click **Toggle connection with the Server**. The Log In to Sentinel EMS screen is displayed.
6. Enter the user name and password to log in to Sentinel EMS; then click **OK**. (The default user name and password are **admin – admin**.) The available Vendor Codes are displayed in the Sentinel Vendor Codes pane.
7. Select **Use Vendor Code from Database**, and then select the relevant Vendor Code.

Your Vendor Code file is named according to the Batch Code labeled on your Sentinel keys. For example, if your keys are labeled with the Batch Code ABCDE, your Vendor Code file is called ABCDE.hvc.

To protect the Bouncing Ball program:

1. In the Sentinel LDK Envelope Project pane, select **Programs**.
2. Click **Add Programs** in the top right of the Programs pane.

The Add Programs window is displayed, showing the contents of the `\VendorSuite\samples` folder.

If a different folder is displayed, browse to:

`%ProgramFiles(x86)%\Gemalto Sentinel\Sentinel LDK\VendorTools\VendorSuite\samples\`

3. Select **Win32_Bounce.exe** and click **Open**. Win32_Bounce is now listed in the Programs pane.
4. In the Project pane, under **Programs**, select **Win32_Bounce**. The Display pane lists the Protection Details.
5. In the **Name** field (to the right of the **Feature ID** field), select **Bounce** from the drop-down list (the Feature that you defined for the Bounce program in *Lesson 2: Defining Features and Products*).

If you are using a Sentinel HL Basic key, select **0** in the **Feature ID** field.

6. In the Project pane, under **Default Protection Settings**, select **Windows**. The Display pane now displays **Windows - Default Protection Settings**.
7. In the Windows - Default Protection Settings pane, decrease the number of **Periodic background checks** from the default value to **5** seconds. This means that during run-time, the protected program will check every 5 seconds to ensure that the required Sentinel HL key is connected.
8. In the Project pane, under **Programs**, select **Win32_Bounce**, then in the Display pane, click **Protect Selected**. A message informs you that the protection process is running.
9. Click **Close** when Sentinel LDK Envelope notifies you that the protection process has completed.

The protected Bouncing Ball program is saved in this folder:

`%HomePath%\Documents\Gemalto\Sentinel LDK 7.8\VendorTools\VendorSuite\Protected`

Protecting the MyNotepad Program

In this section, you create a copy of the Gemalto text viewer sample application, define protection parameters for protecting it using the MyNotepad Feature, and protect the program.

This section is not applicable for Sentinel HL Basic keys.

To protect the MyNotepad program:

1. Locate the Gemalto text viewer application (`textviewer.exe`). This utility can be found under:
`%ProgramFiles(x86)%\Gemalto Sentinel\Sentinel LDK\VendorTools\VendorSuite\samples\`

2. Create a copy of the text viewer application and rename it **MyNotepad.exe**.
3. Verify that your Sentinel Developer key is connected to your computer.
4. If it is not already open, launch Sentinel LDK Envelope. The Sentinel LDK Envelope main window is displayed.
5. Select the program to protect:
 - a. In the Sentinel LDK Envelope Project pane, select **Programs**.
 - b. Click **Add Programs** in the top right of the Programs pane. The Add Programs window is displayed.
 - c. Navigate to the folder where MyNotepad.exe is located. Select the file and click **Open**. Note that a new **MyNotepad** entry is displayed in the Project pane under **Programs**.
6. Protect the selected program:
 - a. In the Project pane, under **Programs**, select **MyNotepad**. The Display pane lists the Protection Details.
 - b. In the **Feature ID** field, type **10** (the Feature defined for the MyNotepad program in *Lesson 2: Defining Features and Products*).
 - c. In the Project pane, under **Default Protection Settings**, select **Windows**. The Display pane now displays **Windows - Default Protection Settings**.
 - d. In the Windows - Default Protection Settings pane, ensure that **Periodic background checks** is set to **5** seconds.
 - e. In the Project pane, under **Programs**, select **MyNotepad**, then in the Display pane, click **Protect**. A message informs you that the protection process is running.
 - f. Click **Close** when Sentinel LDK Envelope notifies you that the protection process has completed. The protected MyNotepad program is saved in this folder:

```
%HomePath%\Documents\Gemalto\Sentinel LDK  
7.8\VendorTools\VendorSuite\Protected
```
7. Close Sentinel LDK Envelope. You are prompted to save the changes to the current project.
8. Click **Save**. The Save As dialog box is displayed.
9. In the **File Name** field, type **Tutoria1** and click **Save**. The dialog box closes and the project is saved.

Defining an Unlocked Trialware Product

Objective	Learn how to define an Unlocked Trialware Product that can be supplied as a trial product
Roles in this lesson	Product Manager, Development
Applications used	Sentinel EMS Sentinel LDK ToolBox (License Generation API)

This lesson is not applicable for Sentinel HL Basic keys.

In this lesson, still in the Production Manager role, you define the “MyNotepad_Evaluation” Product as a trial version of the “MyNotepad_Full” Product you defined in [Lesson 2: Defining Features and Products](#).

An Unlocked Trialware Product is typically used for evaluation purposes, to enable the provision of a grace period, or for super-distribution. An Unlocked Trialware Product can be used on any computer for a limited time period. After the allotted period expires, the software no longer runs until it is activated with a Sentinel protection key.

Defining an Unlocked Trialware Product

In this section, in the Production Manager role, you define the “MyNotepad_Evaluation” Product—an Unlocked Trialware Product that is a trial version of the “MyNotepad_Full” Product, with a license that expires 60 days after the application is first used.

To define an Unlocked Trialware Product in your back office ERP system:

- Fill out your back office spread sheet with the desired parameters for the trialware product.

	A	B	C	D	E
1	Vendor Back Office ERP System				
2					
3	Features				
4		Feature Name	Bounce	MyNotepad	
5		Feature ID	50	10	
6					
7	Products				
8		Base Products			
9		Product ID	11	12	13
10		Base Product	Bounce_Lite	Bounce_Full	MyNotepad_Full
11		Locking Type (Enforcement Type)	HL or SL-AdmiMode	HL or SL-AdmiMode	HL or SL-AdmiMode
12		Feature ID	50	50	10
13		License Type	Execution	Perpetual	Perpetual
14		Number of Executions	3		
15		Memory Offset			0
16		Memory Length			11
17		Memory Content			Hello World
18					
19		Unlocked Trialware Products			
20		Unlocked Trialware Product			MyNotepad_Evaluation
21		Product ID			13
22		Feature			10
23		License Type			Time Period
24		Number of Days			60
25					

You prepare the V2C Unlocked Trialware license file using the License Generation API. For this tutorial, we will use Sentinel LDK ToolBox to call License Generation API functions.

To generate a V2C file for the “MyNotepad_Evaluation” Unlocked Trialware Product:

1. Connect the Sentinel Developer key.
2. From the **Start** menu, select **Programs > Gemalto Sentinel > Sentinel LDK > Vendor Suite**. The Sentinel Vendor Suite program selection window is displayed.
3. Click **ToolBox** to launch Sentinel LDK ToolBox. The Sentinel LDK ToolBox main window is displayed.
4. In the API panel, click **License Generation API**. The functions for the License Generation API are displayed.
5. In the Function pane, select **snt1_lg_initialize**. In the Display pane, click **Execute**. ToolBox calls the **snt1_lg_initialize()** function. The return code for the call is displayed in the **Status** fields. The session handle is displayed in the Handles pane.
6. In the Function pane, select **snt1_lg_start**. You will use this function to define the trialware license.

7. In the Display pane:
 - a. For **License type**, select **SNTL_LG_LICENSE_TYPE_PROVISIONAL**.
 - b. For **Vendor code**, click the browse button. In the VendorCodes directory, select your Vendor Code file.
 - c. For a trialware license, you leave **Current State** empty.
 - d. Click **New Definition**.

You will use the built-in interface screens to generate the license definition XML code. Therefore, there is no need to select a specific license template.

8. In the Edit Template dialog box:
 - a. For **Locking Type**, select **SL-AdminMode**.
 - b. In the **Product** pane, click **New**.
9. In the Edit Product dialog box:
 - a. Set the **Product ID** to 3 and the **Product Name** to **MyNotepad_Evaluation**.
 - b. In the **Feature** pane, click **New**.
10. In the Edit Feature dialog box, set the **Feature ID** to 10, **Feature Name** to **MyNotepad**, **License Type** to **Time Period**, and **Number of Days** to 60. Click **OK**.
11. In the Edit Product dialog box, click **OK**.
12. In the Edit Template dialog box, click **OK**.

ToolBox modifies the XML code in the **License Definition** field according to the information you just entered. The license definition is now configured to generate the **MyNotepad_Evaluation** Unlocked Trialware Product.

You can save this Product definition for future use. Click **Save Template**. In the Save Template dialog box, select **Save as a new Template**. Type the name **MyNotepad_Evaluation** and then click **OK**. The Product will be available in the **License Templates** list.

13. Click **Execute**. ToolBox executes the **sntl_lg_start** function and displays the results.

Make sure that the **Status** field contains 0. This indicates that the license definition is valid and that the **sntl_lg_start** function completed successfully.
14. In the Function pane, select **sntl_lg_generate_license**.
15. Click **Execute**. ToolBox generates the license code.

Make sure that the **Status** field contains 0. This indicates that the license generation function completed successfully.
16. Under the **License** field, click **Save As**. In the Save As dialog box, type the file name **MyNotepad_Eva1** and click **Save**. The trialware license for the **MyNotepad_Evaluation** Product is saved to:

```
%HomePath%\Documents\Gemalto\Sentinel LDK 7.8\Vendor Tools\Vendor Suite\V2C\MyNotepad_Eval.v2c
```

17. In the Function pane, select **sntl_ig_cleanup**, and then click **Execute**. This terminates the session handle and leaves ToolBox ready for the next License Generation API session.

Creating a Run-time Environment Installer

In this section, you assume the Development role. You now create a Sentinel LDK Run-time Environment Installer executable that includes the V2C file created earlier. The Run-time Environment may be required on the end user's computer in order for your Sentinel LDK protected and licensed program to function correctly. (This depends on the type of protection key that you will be providing. For this tutorial, you will install the Run-time Environment.)

In a true production environment, you would only need to embed the Run-time Environment installer in your software setup to create an application that is ready-to-run and is protected and licensed by Sentinel LDK. In this scenario, you have already specified that the MyNotepad program will run in Trial mode for a maximum of 60 days.

In this procedure, you use Sentinel EMS to define a bundle for distributing Unlocked Trialware Products. If you prefer, you can perform the bundling process manually, without the use of Sentinel EMS. For more information, see the *Sentinel LDK Software Protection and Licensing Guide*.

To generate a Sentinel LDK Run-time Environment Installer executable:

1. From the **Start** menu, select **Programs > Gemalto Sentinel > Sentinel EMS > Launch Sentinel EMS**. Sentinel EMS is launched in a Web browser. The Sentinel EMS Login screen is displayed.
2. In the **User ID** and **Password** fields, type **admin**. Click **Login**. The Sentinel EMS screen is displayed.
3. From the function bar in the Sentinel EMS screen, select **Developer > RTE Installer**. The RTE Installer screen is displayed.
4. Select the **Include V2C for Bundle of Unlocked Products** check box.
5. In the **V2C File Location** field, click the browse button.

In the Choose File to Upload dialog box, browse to the directory where you saved the V2C file in step 15 on [page 31](#).

6. Select the **MyNotepad_Eva1.V2C** file displayed in this location and click **Open**. The selected file is displayed in the **V2C File Location** field of the RTE Installer screen.
7. In the **Installer Type** field, ensure that the **Application (EXE)** option is selected.
8. Click **Generate**. The message **RTE file is being created** is briefly displayed.
9. Choose the option to save the file. The file **haspdinst.exe** is saved to:

```
%HomePath%\Documents\Downloads\
```

The location to which the file is saved may vary depending on your operating system and web browser.

WARNING

Do not execute the generated file at this time! You will install this bundle in a later lesson.

You are now ready to ship your Product with its license locked to either a Sentinel SL key as described in [Lesson 6: Creating and Distributing a Sentinel SL-protected Software Order](#), or a Sentinel HL key as described in [Lesson 7: Creating and Distributing a Sentinel HL-protected Software Order](#).

Creating and Distributing a Sentinel SL-protected Software Order

Objective	<ul style="list-style-type: none">■ Learn how to define an order locked to a Sentinel SL key, specify the customer for the order, and produce the order.■ Simulate a variety of end-user interactions with programs protected by Sentinel protection keys.
Role in this lesson	Entitlement Manager, Production, End User
Applications used	<ul style="list-style-type: none">■ Sentinel LDK ToolBox (License Generation API)■ Sentinel LDK ToolBox (Licensing API)■ Sentinel Admin Control Center

This lesson is not applicable for Sentinel HL Basic keys.

In this lesson, we assume that you have received an order for the “MyNotepad” Product that you defined in [Lesson 2: Defining Features and Products](#). Initially, you will ship the trial MyNotepad Product to the customer for installation on the customer’s computer. The license will be locked to a Sentinel SL key that will be activated on the end-user’s machine to convert the trial MyNotepad software to a full-featured product.

When you defined the Products, you specified the license terms for the Features included within those Products at that time. Note that instead of specifying the license terms when you defined the Product, you could have enabled the functionality for specifying the license terms at this stage as part of order processing.

Typically, a customer first installs a trial Product on their computer, and then uses the procedures described in this lesson to convert the Product to a full-featured Product.

You also have the option to bypass the trial phase and to install a full-featured Product on the customer's computer. This procedure is not within the scope of this tutorial.

In this lesson, you will also assume the end-user role to install and use the Product. You will then use the license update received from the vendor to convert a trial version of the software to a full-featured program.

When a customer wants to purchase additional Features or to extend the current license for a Product that has its license locked to a Sentinel SL key, you can update the deployed license, as described in "[Creating an Update for a License in the Field](#)" on page 45.

Installing a Trial Product

In this section, you simulate the experience of the end user when installing and running your MyNotepad "trial" software program.

In a true production environment, your software engineer would typically embed the Run-time Environment installation that includes the trialware license (for trial use) into your software installation so that it executes as part of the installation process. For this tutorial, you perform several installation and simulation steps.

To install the Sentinel Run-time Environment and trialware license on an end-user machine:

1. From the **Start** menu, select **Run**.
2. Click **Browse** and navigate to the location of the RTE Installer (`haspdinst.exe`) that you created earlier on [page 32](#).
3. Select the `haspdinst.exe` file and click **Open**. The browse window closes, and the file path is displayed in the **Open** field.
4. In the **Open** field, type a space followed by `-i` at the end of the file path.

For example:

```
"C:\Users\Thomas\Downloads\haspdinst.exe" -i
```

5. Click **OK**. The Sentinel Run-time Environment is installed and a success message is displayed.

To confirm the license status of the trial Product:

1. Navigate to the following folder:

```
%HomePath%\Documents\Gemalto\Sentinel LDK 7.8\VendorTools\VendorSuite\Protected
```
2. Double-click **MyNotepad.exe**.
3. While the application is running, from the **Start** menu, select **Programs > Gemalto Sentinel > Sentinel LDK > Tools > Admin Control Center**.

(The Sentinel Admin Control Center is part of the Run-time Environment.)

4. In the Options pane, select **Sentinel Keys**. All the Sentinel protection keys that are accessible on the Sentinel License Manager are displayed.

#	Location	Vendor	Key ID	Key Type	Version	Sessions	Actions
0	Local	Demo MB	1058355007411405208	SL-AdminMode	2.00	-	Products Features Sessions Certificates
1	Local	Master	840659384	Master	3.25	-	Features Sessions Blink on
2	Local	Master	1720199720	Developer	3.25	-	Features Sessions Blink on

5. Locate the entry for your key and click the **Features** button in the **Actions** column. The Features that are licensed in your key are displayed.

Note that the **Logins** field shows that there is currently one login to MyNotepad_Evaluation and that the **Restrictions** field for Feature ID 10 indicates that the 60-day trial has begun.

6. Close the MyNotepad program.

Defining a Perpetual License

In this section, we assume that the end user is satisfied with the MyNotepad_Evaluation product and has placed an order for a perpetual license.

You would include a small routine in the Unlocked Trialware Product installer that collects information from the end user's computer and generates a C2V file. The end user would activate this routine and then send you the generated C2V file by email.

Next, you will create a license for the "MyNotepad_Full" Product that you defined in [Lesson 2: Defining Features and Products](#), locked to the user's Sentinel SL key. This license will then be used to convert the trial MyNotepad_Evaluation Product on the user's computer (that you defined in [Lesson 5: Defining an Unlocked Trialware Product](#)) to a full-featured product.

Collecting Information on the End User's Computer

In the role of the end user, you will collect information about your computer and send it to the vendor. This information is required in order to prepare the perpetual license that you ordered. (This process can be partially or completely automated in the protected application.)

To simulate collection of information on the end user's computer:

1. Start Sentinel LDK ToolBox.
2. In the API panel, click **Licensing API**; then select the **hasp_get_info** function.
3. In the Display pane:
 - a. In the **Scope Template** field, select Local HASP HL Only.
 - b. In the **Format Template** field, select Create C2V.
 - c. In the **Vendor code** field, click the browse button. In the VendorCodes directory, select your Vendor Code file.
 - d. Click **Execute**. The information for the local computer is displayed on the **Output** tabbed page.

- e. On the **Output** tabbed page, click **Save As**. Save the C2V file. This file must be transmitted to the vendor.

Defining the License for the End User

To define a perpetual license:

1. Start Sentinel LDK ToolBox (if it is not already active) and click **Work Offline**. The Sentinel LDK ToolBox main window is displayed.
2. At the bottom of the Function pane, click **License Generation API**. The functions for the License Generation API are displayed.
3. In the Function pane, select `sntl_1g_initialize`. In the Display pane, click **Execute**.
4. In the Function pane, select `sntl_1g_start`.
5. In the Display pane:
 - a. For **License type**, select `SNTL_LG_LICENSE_TYPE_UPDATE`.
 - b. For **Vendor code**, click the browse button. In the VendorCodes directory, select your Vendor Code file.
 - c. For **Current State**, click the browse button. Navigate to the C2V file you received from the end user.
 - d. Click **New Definition**.
6. In the Edit Template dialog box:
 - a. For **Locking Type**, select **SL-AdminMode**.
 - b. In the **Product** pane, click **New**.
7. In the Edit Product dialog box:
 - a. Set the **Product ID** to 3 and the **Product Name** to `MyNotepad_Full`.
 - b. In the **Feature** pane, click **New**.
8. In the Edit Feature dialog box, set the **Feature ID** to 10, **Feature Name** to `MyNotepad`, and **License Type** to `Perpetua1`. Click **OK**.
9. In the Edit Product dialog box, click **OK**.
10. In the Edit Template dialog box:
 - In the Memory Segment pane, click **New**.
11. In the Edit Memory Segment dialog box:
 - a. Set **Memory Type** to `HASP_FILEID_RW`, **Offset** to 0 and **Length** to 16.
 - b. Erase the sample text on the right side of the pane. Type in the text: `Hello World`
 - c. Click **OK**.

12. In the Edit Template dialog box, click **OK**.
ToolBox modifies the XML code in the **License Definition** field according to the information you just entered. The license definition is now configured to generate the MyNotepad_Full Product.
13. Click **Execute**. ToolBox executes the `sntl_1g_start` function and displays the results.
Make sure that the **Status** field contains 0. This indicates that the license definition is valid and that the `sntl_1g_start` function completed successfully.
14. In the Function pane, select `sntl_1g_generate_license`.
15. Click **Execute**. ToolBox generates the license code.
Make sure that the **Status** field contains 0. This indicates that the license generation function completed successfully.
16. Under the **License** field, click **Save As**. In the Save As dialog box, type the file name `MyNotepadFull` and click **Save**. The perpetual license for the MyNotepad_Full Product is saved as `MyNotepadFull.v2c`.
17. In the Function pane, select `sntl_1g_cleanup`, and then click **Execute**.

Activating a Product With a License Update

Several methods are available to deliver the license update to the end user and activate the Product. For this tutorial, we will use Sentinel Admin Control Center to activate the Product.

In this section, in the role of the end user, you assume that you have purchased the MyNotepad_Full program and received a License Update (V2C) file from the vendor. You use this file to convert the trial version of the software to a full-featured program that is locked to your machine.

To simulate activation of the program:

1. From the **Start** menu, select **Programs > Gemalto Sentinel > Sentinel LDK > Tools > Admin Control Center**.
2. In the Options pane, select **Update/Attach**.
3. In the Update/Attach screen, click **Browse** and navigate to the `MyNotepadFull.v2c` file provided by the vendor. Select the file and click **Open**.
4. In the Update/Attach screen, click **Apply File**. A confirmation message is displayed.
5. In the Options pane, select **Features**. You can see that you now have a **Perpetual** license for Feature ID 10.

Creating and Distributing a Sentinel HL-protected Software Order

Objective	Learn how to define Products to be locked to Sentinel HL keys, and to burn the keys Simulate a variety of end-user interactions with programs protected by Sentinel protection keys Learn how to update a license in the field
Roles in this lesson	Entitlement Manager, Production, End User
Applications used	Sentinel LDK ToolBox (License Generation API) Sentinel LDK ToolBox (Licensing API) Sentinel Admin Control Center

This lesson is not applicable for Sentinel HL Basic keys.

In this lesson, we assume that you have received two different orders, which you will produce so that they are ready for shipment. You also assume the end-user role to test different types of Sentinel protection keys and licenses.

When a customer wants to purchase additional Features, or to extend the current license for your protected program, you can update the deployed license without having to recall or redeploy keys.

In this lesson, you will also learn how to update the deployed license.

The orders that you will process are based on the Products that you defined in [Lesson 2: Defining Features and Products](#), and include:

- An order for the “Bounce_Lite” Product.
- An order to upgrade the “Bounce_Lite” Product to the “Bounce_Full” Product. This order will be used to update the license on the Sentinel HL key provided to the end user with the “Bounce_Lite” Product. You will learn how to convert its functionality from Bounce_Lite to Bounce_Full in the field.

When you defined the Products, you specified the license terms for the Features included within those Products at that time. Note that instead of specifying the license terms when you defined the Product, you could have enabled the functionality for specifying the license terms at this stage as part of order processing.

Defining a “Rental” Product Order With Sentinel HL Locking

In this section, you define a license for the “Bounce_Lite” Product, and lock the license to a Sentinel HL key.

To prepare the Bounce_Lite license:

1. Connect to your computer the Sentinel HL key to which you want to burn the order.
2. Start Sentinel LDK ToolBox.
3. In the API panel, click **Licensing API**; then select the **hasp_get_info** function.
4. In the Display pane:
 - a. In the **Scope Template** field, select **Local HASP HL Only**.
 - b. In the **Format Template** field, select **Create C2V**.
 - c. In the **Vendor code** field, click the browse button. In the VendorCodes directory, select your Vendor Code file.
 - d. Click **Execute**. The information for the connected HL key is displayed on the **Output** tabbed page.
 - e. Note that one of the XML tags near the top of the page is this:

```
<hasp id="[protection_key_id]">
```

This number is the unique identifier for the Sentinel HL key that is currently attached to the computer. Save this number in a temporary location - we will use it later in this procedure.
 - f. On the **Output** tabbed page, click **Save As**. Save the C2V file to the default location.
5. In the API panel, click **License Generation API**. The functions for the License Generation API are displayed.
6. In the Function pane, select **sntl_ig_initialize**. In the Display pane, click **Execute**. The session handle is displayed in the Handles pane.
7. In the Function pane, select **sntl_ig_start**. You will use this function to define the license.

8. In the Display pane:
 - a. For **License type**, select `SNTL_LG_LICENSE_TYPE_UPDATE`.
 - b. For **Vendor code**, your Vendor Code file should appear by default.
 - c. For **Current State**, click the browse button. Select the C2V file that you saved in step 4f above.
 - d. Click **New Definition**. Use the information from our ERP system (page 19 to define the Bounce_Lite Product.
9. Click **Execute**. ToolBox executes the `sntl_lg_start` function and displays the results. Make sure that the **Status** field contains 0.
10. In the Function pane, select `sntl_lg_generate_license`.
11. Click **Execute**. ToolBox generates the license code. Make sure that the **Status** field contains 0.
12. Under the **License** field, click **Save As**. In the Save As dialog box, save the license as `Bounce_Lite.v2c` on the desktop.
13. Under the **Resultant State** field, click **Save As**. In the Save As dialog box, create a folder called `Key_States` on your desktop. Save the state file as `keyState_[key_id].xml` in this folder. `key_id` is the identifier of the protection key ID that you recorded in step 4e. (For this tutorial, you can use just the last 2 digits of the key ID.)

In a production environment, you should record the protection key ID and save the state file in your ERP system as part of the information for the customer.

The state file contains the state of the end user's protection key that will exist after the V2C file is applied to the protection key. You need this file for future updates to the end user's protection key. If you do not save this file now, then in the future, you must obtain the state of the end user's protection key before you can send any protection key updates to the customer.

14. In the Function pane, select `sntl_lg_cleanup`, and then click **Execute**.

To burn the Bounce_Lite license to the connected Sentinel HL key:

1. In the ToolBox API panel, click **Licensing API**; then select the `hasp_update` function.
2. In the **Update Data** field, click the browse button. Navigate to the `Bounce_Lite.v2c` file that you saved in the previous procedure. Select the file and click **Open**. The full path of the file appears in the **Update Data** field.
3. Click **Execute**. The license is burned to the HL key. (Make sure that the **Status** field contains 0.)

Using an Application With a Sentinel HL Key

When a customer receives an application you protected with a Sentinel HL key, the actual key must be accessible by the application in order to run the program. In the following procedure,

you assume the end-user role to test Bounce, with a Bounce_Lite license locked to a Sentinel HL key.

In this part of the lesson, you use Sentinel Admin Control Center to examine your licensed software. In a true production environment, a system administrator in your customer's organization uses this Web-based application to manage network licenses for your software.

To operate a Product protected with a Sentinel HL key:

1. Connect the Sentinel HL key on which you burned the order to your computer. The required licensing information for Bounce_Lite is contained, in encrypted format, in the key. As long as the license is valid, the protected application can run.
2. (Optional) Examine the license on the HL key as follows:
 - a. From the **Start** menu, select **Programs > Gemalto Sentinel > Sentinel LDK > Tools > Admin Control Center**. Sentinel Admin Control Center is displayed. This interface enables customers to track the status and usage of their Sentinel licenses.
 - b. In the Options pane, select **Sentinel Keys**. All the Sentinel protection keys that are accessible on the Sentinel License Manager are displayed.

#	Location	Vendor	Key ID	Key Type	Version	Sessions	Actions
0	Local	Demo MB	1058355007411405208	SL-AdminMode	2.00	-	Products Features Sessions Certificates
1	Local	Master	840669384	Master	3.25	-	Features Sessions Blink on
2	Local	Demo MB	2136683878	HL NetTime 250+	3.25	-	Features Sessions Blink on

- c. Locate the entry for your Sentinel HL key and click the **Features** button in the **Actions** column. The Features that are licensed in your key are displayed.

Note that the **Restrictions** field for Feature ID 50 displays **Executions 3 left**, indicating that the remaining number of logins permitted by the license is **3**.

3. Navigate to the following folder:

```
%HomePath%\Documents\Gemalto\Sentinel LDK 7.8\VendorTools\VendorSuite\Protected
```
4. Double-click **Win32_Bounce.exe**. The Bouncing Ball program launches.
5. Close the Bounce software.
6. Repeat step 4 and step 5 two more times, to consume all the permitted executions.
7. Repeat step 4. Bounce fails to open and a message is displayed indicating that the Feature has expired.
8. In Sentinel Admin Control Center, in the Options pane, select **Sentinel Keys**.
9. Locate the entry for your Sentinel HL key and click the **Features** button in the **Actions** column.

If you are not sure which entry relates to your specific key, click the **Blink on** button and identify the key on which the LED is blinking.

Note that the **Restrictions** field for Feature ID 50 displays **Expired**, meaning that the number of allowed logins defined in the license has been exhausted.

Creating an Update for a License in the Field

Your customer requested a license upgrade—from Bounce_Lite to Bounce_Full. In this part of the lesson, you will generate an update to the HL key that is located on the end user's computer. You will then assume the role of the end user to activate the license update.

To produce an update license for the customer's HL key:

1. Start Sentinel LDK ToolBox.
2. In the API panel, click **License Generation API**. The functions for the License Generation API are displayed.
3. In the Function pane, select `sntl_1g_initialize`. In the Display pane, click **Execute**. The session handle is displayed in the Handles pane.
4. In the Function pane, select `sntl_1g_start`. You will use this function to define the update license.
5. In the Display pane:
 - a. For **License type**, select `SNTL_LG_LICENSE_TYPE_UPDATE`.
 - b. For **Vendor code**, your Vendor Code file should appear by default.
 - c. For **Current State**, click the browse button. Navigate to the file `keyState_[key_id].xml` that you saved in step 13 on [page 43](#). This file contains the current state of the customer's HL key.
 - d. Click **New Definition**. Use the information from our ERP system ([page 19](#)) to define the Bounce_Full Product.
6. Click **Execute**. ToolBox executes the `sntl_1g_start` function and displays the results. Make sure that the **Status** field contains 0.
7. In the Function pane, select `sntl_1g_generate_license`.
8. Click **Execute**. ToolBox generates the license code. Make sure that the **Status** field contains 0.
9. Under the **License** field, click **Save As**. In the Save As dialog box, save the license as `Bounce_Full.v2c` in the path:

`%HomePath%\Documents\Gemalto\Sentinel LDK 7.8\VendorTools\VendorSuite\v2c`

In a true production environment, you would also save the content of the **Resultant State** field as `keyState_[key_id].xml` in your ERP system in place of the key state file you saved earlier. You need this file for future updates to the protection key. If you do not save this file now, then in the future, you must obtain the state of the end user's protection key before you can send any protection key updates to the customer.

10. In the Function pane, select `sntl_1g_cleanup`, and then click **Execute**.

Updating a License at the Customer's Site

In this section, you retain the role of the end user. You have purchased the full-featured version (Bounce_Full) of the program to replace the execution-based Bounce_Lite version. You update your license using the Sentinel Admin Control Center and the **Bounce_Full.v2c** file that you receive from the vendor.

To apply a license update:

1. Ensure that the appropriate Sentinel HL key is connected to your computer.
2. Launch Sentinel Admin Control Center:
 - From the **Start** menu, select **Programs > Gemalto Sentinel > Sentinel LDK > Tools > Admin Control Center**. Sentinel Admin Control Center is displayed.
3. In the Options pane, select **Update/Attach**. The Update/Attach License window is displayed.
4. Click **Browse** and navigate to the following folder:
%HomePath%\Documents\Gemalto\Sentinel LDK 7.8\VendorTools\VendorSuite\v2c
5. Select the Bounce_Full.v2c file that you created in step 9 above (on page 45), when producing the order for the license update in your Entitlement Manager role.
6. Click **Open**. The file path is displayed in the **Select a V2C... file** field.
7. Click **Apply File**. A message is displayed confirming that your update was applied successfully.
8. In the Options pane, select **Sentinel Keys**.
9. Locate the entry for your Sentinel HL key and click the **Features** button. The Features that are licensed in your key are displayed.

Note that an additional row was created for Feature ID 50. The **Restrictions** field in this row is **Perpetual**, indicating that the remaining number of logins permitted by the license is unlimited.

10. Navigate to the following folder:
%HomePath%\Documents\Gemalto\Sentinel LDK 7.8\VendorTools\VendorSuite\Protected
11. Double-click Win32_Bounce.exe.
The Bouncing Ball program launches.
12. Close the Bouncing Ball program and disconnect the Sentinel HL key.

This lesson demonstrates using Sentinel Admin Control Center to examine licenses and to update a license at the customer's site.

Sentinel Admin Control Center is part of the Sentinel LDK Run-time Environment. The Run-time Environment was placed on your computer when you installed Sentinel LDK Vendor Tools. However, the Run-time Environment is not required for Sentinel HL Driverless keys.

If you have not included the Run-time Environment with your protected application, you can update licenses at the customer's site using other methods. For more information, see the description of the Sentinel Remote Update System in the *Sentinel LDK Software Protection and Licensing Guide*.

Using Sentinel Licensing API

Objective	Learn how to implement Sentinel Licensing API functions using Sentinel LDK ToolBox
Role in this lesson	Development
Applications used	Sentinel LDK ToolBox

Now that you have completed the other lessons in this tutorial, you should have a good understanding of how Sentinel LDK works and how to operate Sentinel LDK ToolBox.

This lesson builds on your accumulated knowledge and demonstrates more advanced techniques to work with Sentinel LDK Licensing API through Sentinel LDK ToolBox.

To perform this lesson, launch Sentinel LDK ToolBox and proceed through the tasks that follow.

Before you perform this lesson, make sure that you have completed [Lesson 3: Using Sentinel LDK ToolBox](#).

Starting With Login

Each Sentinel Licensing API session typically begins with the `hasp_login` API call, which establishes a connection with a Sentinel protection key and enables access to its resources. For this lesson, you will connect a Sentinel HL key.

`hasp_get_info()` and `hasp_update()` are standalone functions. You do not have to log in before you call these functions.

To log in to the Sentinel HL key:

1. Connect a Sentinel HL key.
2. In the Function pane, select **hasp_login**. The Display pane displays all the parameters with the default values that are appropriate for the login operation.

3. Specify the location of your stored Vendor Code file.

To locate your Vendor Code file, click the browse button.

By default, Vendor Codes are stored in:

`%HomePath%\Documents\Gemalto\Sentinel LDK 7.8\VendorCodes`

The file is named according to the label printed on your keys. For example, if the keys are labeled with Batch Code **ABCDE**, by default, your Vendor Code file is named **ABCDE.hvc**.

4. Select your Vendor Code file and click **Open**. The code is displayed in the **Vendor Code** field.
5. In the **Feature ID** field, type **50**.

You must specify a Feature ID that exists in the protection key. If you did not define Feature ID 50 earlier in the tutorial or if you are using a Sentinel HL Basic key, select **0** in the **Feature ID** field.

6. At the bottom left of the **hasp_login** pane, click **Execute**. The result of the executed login is summarized to the right of the **Execute** button in three **Status** fields—number, code and message.

Encrypting Data and Writing to Memory

Now that you have established a session with the connected Sentinel protection key, you can access its resources through other API calls.

One of the most important and powerful resources available in a Sentinel protection key is its internal encryption engine. You can optimize protection by using this engine and the encryption facilities in Sentinel LDK as an additional method for verifying that the correct key is accessible when the protected program is running. To do this, proceed as follows:

- Encrypt a string using the Sentinel protection key
- Incorporate the encrypted string into the application source code
- Define your source code to send the encrypted string to the key for decryption and then to verify the result

In its encrypted form, the string prevents the program from running correctly. The protected program will run only if it can decrypt the string, and this can only be achieved if the Sentinel protection key is accessible. This section demonstrates how the key encrypts and decrypts a string.

To encrypt a string:

1. In the Function pane, select **hasp_encrypt**. The Display pane displays parameters for the `hasp_encrypt` API call.
2. Specify the **Size** as **100**.
3. Click the first dot to the right of the memory editor, on the far right of the window, and type: **Gemalto, Inc.**
4. Click **Execute**. Note that the string has been encrypted by the Sentinel protection key and is now illegible.

Sentinel LDK uses a unique encryption key for each encryption process, based on your unique Sentinel Vendor keys and the current Feature. Therefore, the string you type is encrypted differently from any other software vendor (and differently for each Feature)

5. In the Function pane, select **hasp_decrypt**. The editor still displays the encrypted string.
6. Click **Execute**. The Sentinel protection key decrypts the string. **Gemalto, Inc.** is now displayed in the editor.

If you are using a Sentinel HL Basic key, you have completed the tutorial. Proceed to *"What's Next?" on page 52.*

Retrieving Sentinel Protection Key Information

Sentinel LDK ToolBox enables you to retrieve key-related information. In this section, you use the `hasp_get_sessioninfo` function to retrieve information relating to the identity and memory size of the Sentinel protection key.

To retrieve Sentinel protection key information:

1. In the Function pane, under **Management**, select **hasp_get_sessioninfo**. The Display pane displays parameters for the `hasp_get_sessioninfo` API call.
2. In the Display pane, from the **Format Template** drop-down list, select **HASP_KEYINFO**. Note that a description of the Format definition is displayed in the gray box below the **Information** field.
3. Click **Execute**. The Information pane displays XML tags with information on the key, including:
 - The unique ID number of the connected key
 - The key Read/Write memory size
 - The key Read-only memory size

Reading and Programming Sentinel Protection Key Memory

In this section, you log in to Feature ID 10 on the Sentinel SL key that you defined in *Lesson 5: Defining an Unlocked Trialware Product*. You write to and then read from the memory of the protection key.

To log in to the Sentinel protection key:

- Follow the Sentinel HL key login procedure on [page 50](#), but this time, in step 5, type **10**.

To program the Sentinel protection key memory:

1. In the Function pane, under **Memory**, select **hasp_write**. The Display pane displays parameters for the **hasp_write** API call and an editor for the Sentinel protection key memory.
2. In the memory editor, set the **Offset** field to **16** and the **Length** field to **24**.
3. On the right side of the pane, click the first “.” and type:

```
The World says Hello
```
4. Click **Execute**. The string is stored in the protection key memory.

To read the Sentinel protection key memory:

1. In the Function pane, under **Memory**, select **hasp_read**. The Display pane displays parameters for the **hasp_read** API call and an editor for the Sentinel protection key memory.
2. In the memory editor, set the **Offset** field to **0** and the **Length** field to **40**.
3. Click **Execute**. The memory editor now displays:
 - the string `Hello World`, which you stored in the key in [Lesson 6: Creating and Distributing a Sentinel SL-protected Software Order](#).
 - the string that you typed above, in step 3.

What's Next?

This concludes the Sentinel LDK API tutorial. You are now ready to use Sentinel LDK applications to license your software and protect it against unauthorized use.

For additional information about the Sentinel LDK system, refer to the *Sentinel LDK Software Protection and Licensing Guide* and to the Help documentation available in the Sentinel LDK applications.
